

Does your core banking platform provide a complete view of information?

OnBase connects the data in your core banking platform to related content outside

You've invested in a core banking system to manage daily processes and transactions.

But you have critical related content – from documents and forms to notes and emails – that your core banking platform can't effectively manage. This leaves your employees without easy access to all the information required to make decisions, manage processes and provide superior service.

CORE BANKING PLATFORM

Customer/member account information and daily banking transactions

RELATED CONTENT

What if you could complete the picture?

OnBase complements your core banking platform, providing employees with a complete view of the information they need, when and where they need it.

OnBase centralizes all types of critical content and connects it to the data in your core, providing users with instant access to all relevant information directly from their familiar system interface.

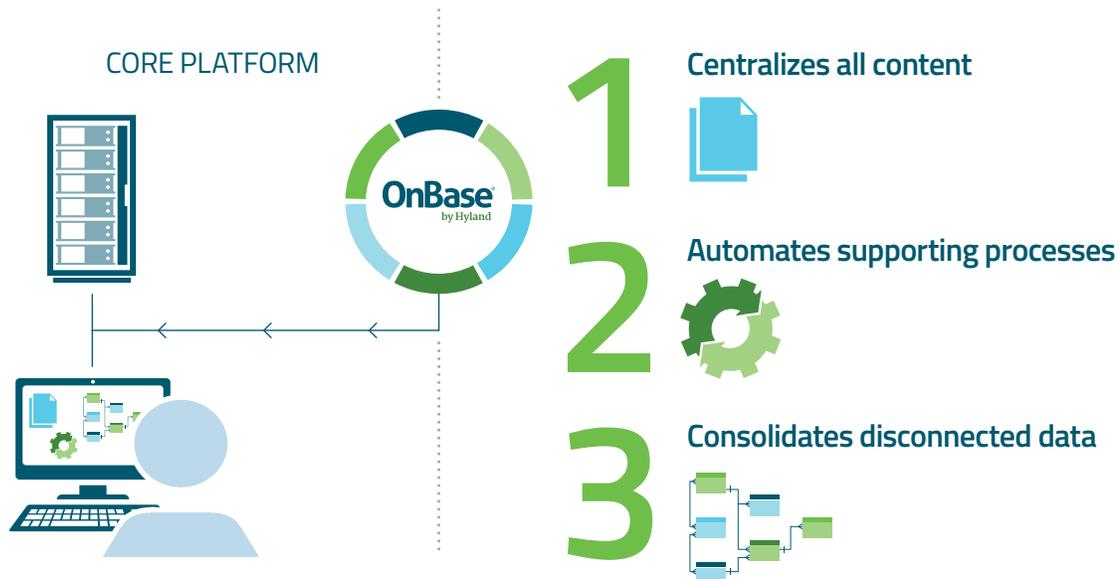

OnBase displays the related content within the core system user interface

One platform **Unlimited potential**

OnBase
by Hyland

OnBase goes beyond linking content to your core by also managing the related **processes and data** – all on a **single enterprise information platform**.

1. Centralizes all content: Core banking platforms are designed to handle daily banking transaction data and provide only a basic content repository with limited capabilities. OnBase delivers a full range of enterprise-class, secure document management capabilities on a single platform, seamlessly integrated with your core system.

2. Automates supporting processes: While your core handles certain processes, there are other processes that are either very expensive to implement or that your system simply wasn't designed to handle, such as loan application review, tracking fraud investigations, wire transfers and records management. OnBase allows you to quickly and easily extend existing processes and create new ones.

3. Consolidates disconnected data: While your core manages specific business data, there are related tasks, activities, conversations and other information being managed outside these systems – via email inboxes, spreadsheets, antiquated databases and legacy applications. OnBase consolidates scattered data, tasks and activities living outside your core into a single location where they are connected and tracked.

OnBase provides these tools not only for a single business system but for multiple systems and applications across your enterprise.
